PrimeSTAR PCR

PROTOCOL

1. For each reaction you set up, **top-label a PCR tube** with the name(s) indicated on the labsheet.
2. Retrieve your **oligos** (10 µM) and **template** from the freezer and thaw them at room temperature.
3. Set up the reaction, in order:

32	ddH_2O
10	5× PrimeSTAR GXL buffer
4	dNTP mix (2.5 mM each)
1	primer 1 (10 µM)
1	primer 2 (10 µM)
1	template
1	PrimeSTAR GXL polymerase
50	**µL total**

4. Retrieve the **enzyme cooler**, and add **1 µL polymerase** to each sample, last.
5. **Cap**, **slam on the bench** to mix, **quick spin**.
6. Run the program from your labsheet — it depends on insert length and annealing temperature.

MASTER MIX — 5 OR MORE REACTIONS

Scale **everything except the template** by the number of reactions, plus **10%** so you do not run short on the last tube.

Each tube is then **49 µL master mix + 1 µL template**, and the template is the only thing you pipette per-tube.
